Updated 06/22/2026

IRoute Platform Review (MVP)

A quick review of the features and logic of the initial version.

1. Client Account

1.1. Field Validation Rules:

- 1.1.1. **Arabic Name:** Accepts Arabic characters only.
- 1.1.2. **English Name:** Accepts English characters only.
- 1.1.3. **Commercial Registration No.:** Numbers only (no letters or special characters).
- 1.1.4. **Tax Registration No.:** Numbers only (no letters or special characters).

1.2. Billing Defaults Fields:

- 1.2.1. The "BILLING DEFAULTS" section was successfully removed during record creation, but it still appears when editing an existing record.

Required Fix: Please ensure this section is completely removed.

1.3. Sub-Table Actions (Client Profile Tabs)

- 1.3.1. For all sub-tables within the client profile tabs (e.g., Attachments, Addresses, etc.), the available actions must include both **Edit** and **View**.

Apply this to all similar detailed views across the system.

- 1.3.2. Attachment Preview: Clicking on any attachment name—whether in the client profile or anywhere else across the system—must open a preview of the file.

Apply this to all similar detailed views across the system.

Attachments & Documents

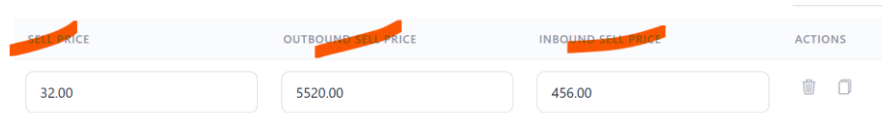

TITLE
CA_cce1cd980_2209_440a_af87_f6a2bb3b470f.png
CA_f70cd5f8_78b8_4a0a_8c76_201ced94e979.pdf

1.4. Client Contract Basic Logic:

- 1.4.1. **Prevent Overlapping Contracts:** Do not allow duplicate or overlapping contracts for the same client within the same period (checking both start and end dates).
- 1.4.2. **Restrict Contract Deletion:** Prevent deleting a client contract if there are transactions (e.g., bookings or shipments) within the contract period.

2. Price List:

- 2.1.1. I tested Sell Price, can't edit its value, Prices fields in the price list must be fully editable **by the user**.

SELL PRICE	OUTBOUND SELL PRICE	INBOUND SELL PRICE	ACTIONS
32.00	5520.00	456.00	

- 2.1.2. Base Service Price Changes Override Price Lists:

Current Behavior: Modifying the Sell Price in the original service record incorrectly updates and overrides the Sell Price in the Price List table.

Fix Requirements: The Price List should only fetch the **price fields** once the service is selected. Any subsequent updates to the original service **price fields** must not affect existing price lists, as they are meant to store independent, custom prices.

3. Booking:

3.1. POD Type List Value must be as below:

- **Digital:** will accept digital evidence as POD.
- **Soft Copy:** There is a POD Document attached for the shipment and will accept soft copy of it as POD.
- **Hard Copy:** There is a POD Document attached for the shipment and must collated it to verify the POD.

As we previously defined, the field values and properties are repeated wherever they are used in the system.

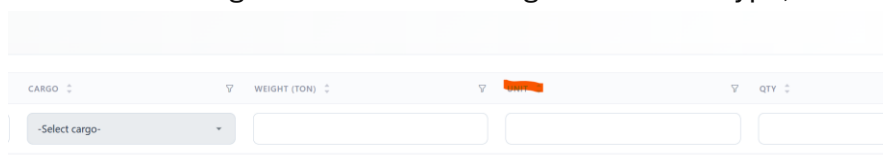

3.2. POD Status List Value must be as below:

- **Completed**
- **Not Completed**

As we previously defined, the field values and properties are repeated wherever they are used in the system.

- 3.2.1. POD Status must be disabled and create or edit, it will update only auto by system as per POD logic.

3.3. Unit field in Cargo table in the Booking must be Text type, not Number!

CARGO	WEIGHT (TON)	Unit	QTY
-Select cargo-			

3.4. Booking Status list value must be as below:

- Draft
- Confirmed
- In Progress
- Completed
- Partially Completed

Cancelled

As we previously defined, the field values and properties are repeated wherever they are used in the system.

3.4.1. Logic behind Booking Status:

Draft	Save as a Draft!
Confirmed	Confirm Booking!
In Progress	Once the Driver press Start Job
Completed	When all shipments related to the booking are completed.
Partially Completed	In case of Round Trip and Only 1 Shipment is completed 1/2
Cancelled	In case of Cancel booking. Cancellation Logic: - If there are no shipments on the Booking. - if all shipments on the Booking are canceled.

3.4.2. Booking items Status list of Value:

it will be as same as Booking Status but without Partially Completed.

3.4.3. Booking Actions:

Add a "**Cancel**" action to the booking actions.

Clicking it will apply and check the cancellation logic above.

This action only appears if the booking status is not "Cancelled".

Cancel process will be a log in Action log.

3.5. The 3 booking scenarios:

3.5.1. There are three booking scenarios: **Round** trip, **Outbound**, and **Inbound**.

- In case of **Round**, the price fetched from the Price list is **Sell Price**.
- In case of **Outbound**, the price fetched from the Price list is **Outbound Price**.
- In case of **Inbound**, the price fetched from the Price list is **Inbound Price**.

Note: Outbound and Inbound cases will identify as per **Route field value**:

Ex: Service: Jeddah to Yanbu

Outbound (Jeddah to Yanbu)

Inbound (Yanbu to Jeddah)

- Currently the system **calls and fetch only the Sell Price** in all scenarios, **we need to fix it as per logic above.**

3.6. The Service filed in the booking must have filter as following:

Service type = Trip.

3.7. Booking Trip Type Edit & Update Logic:

3.7.1. The **Trip Type** field must remain **disabled** during **Edit Booking mode**.

3.7.2. Add Booking Item Actions during **Edit Booking mode**:

3.7.2.1. **Delete Action:** Allowed only if there is no shipment related to the Booking Item (User can delete only one item).

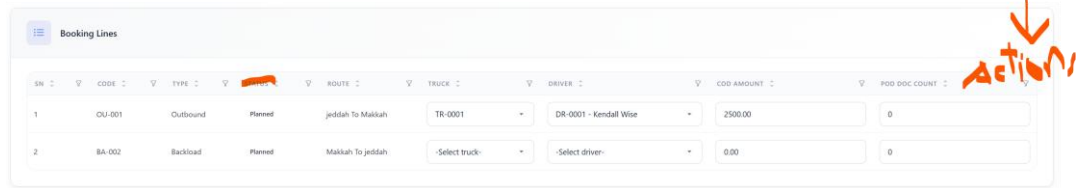

3.7.2.2. **Cancel Action:** Allowed if the related shipment is cancelled (The item cannot be deleted, only cancelled).

3.7.3. Automatic Field Updates (Upon Deletion or Cancellation):

3.7.3.1. **Trip Type:** Automatically updates to "One-Way".

3.7.3.2. **Route:** Dynamically updates based on the removed/cancelled item (depending on whether Item 1 [Outbound] or Item 2 [Inbound] was removed or Cancelled).

3.7.4. The overall **Booking Status** must automatically update based on the system logic and the final state of the booking.

SN	CODE	TYPE	STATUS	ROUTE	TRUCK	DRIVER	COD AMOUNT	POD DOC COUNT	Action
1	OU-001	Outbound	Planned	jeddah To Makkah	TR-0001	DR-0001 - Kendall Wise	2500.00	0	
2	BA-002	Backload	Planned	Makkah To jeddah	-Select truck-	-Select driver-	0.00	0	

3.8. Booking and Shipments Validation Rules (Duplicate Prevention):

3.8.1. Prevent adding bookings of shipment if any of the following conditions are met:

- 3.8.1.1. Same Driver + Same Date
- 3.8.1.2. Same Truck + Same Date
- 3.8.1.3. Same Truck and Driver + Same Date.

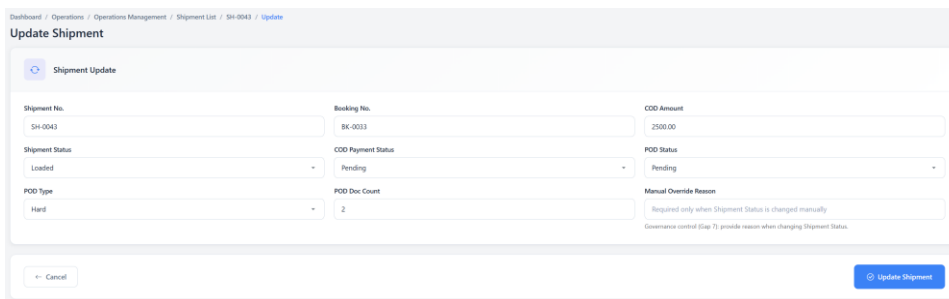

4. Shipment

4.1. Remove (Update Action)

4.1.1. **Action to Remove:** Completely remove the "Update Action" action/button and its corresponding popup screen.

4.1.2. **Field Placement:** All shipment fields must be displayed directly in their correct positions within the main Create and Edit forms.

4.1.2.1. Only **Remove** Manual Override Reason field at all.

Dashboard / Operations / Operations Management / Shipment List / SH-0043 / Update

Update Shipment

Shipment Update

Shipment No. SH-0043	Booking No. BK-0033	COD Amount 2500.00
Shipment Status Loaded	COD Payment Status Pending	POD Status Pending
POD Type Hard	POD Doc Count 2	Manual Override Reason Required only when Shipment Status is changed manually Governance control (Step 7): provide reason when changing Shipment Status.

[Cancel](#) [Update Shipment](#)

SHIPMENT NO	DATE	STATUS	CLIENT	BOOKING	TYPE	ROUTE	COD STATUS	ACTIONS
SH-0043	17 Jun 2026	Cancelled	CA-0001 - UATC	BK-0033	COD	jeddah → Makkah	Cancelled	Edit View Update Update Truck
SH-0042	17 Jun 2026	Closed	CA-0001 - UATC	BK-0032	COD	jeddah → Makkah	Collected	
SH-0041	17 Jun 2026	Closed	CA-0001 - UATC	BK-0031	COD	jeddah → Makkah	Collected	

4.2. Add Action in Shipment (Cancel)

4.2.1. Cancel logic, user able to Cancel shipment at any stage or status.

4.2.2. Cancel process will be a log in Action logs.

4.2.3. Shipment Can't be delated at any case.

5. Shipment PODs

- 5.1. **Doc No field** must be linked to **Shipment Document**, NOT to Shipment!
 - **Label** is (Doc No + Doc Ref).
 - **Filter**, Is Delivery Note? = Enable.
- 5.2. **Doc Ref field**:
 - **Filter**: On Doc No,
 - **Disabled**
 - **Value**: Fetch
- 5.3. **Booking No**, will filter on **Doc No**, **Booking Item** will filter on **Booking No**, **Shipment** will filter on **Booking item**. And all of them will be **Disabled** and Fetch as per **Doc No**, in additional to **POD Type**.
- 5.4. **Remove** Hard Copy Tracking at all!
- 5.5. **Remove Location field**
- 5.6. **POD Pages Lines**:
 - 5.6.1. **Action log field** must be filtered on **Shipment field** on the herder.
 - 5.6.2. **Map URL and Attachment fields must be fetched from action log**.

6. Truck Master

- 6.1. **Is Company info the same as Owner info?**
Not working!
Logic: if it's enabled mut fetch the information from **Organization Profile and fill out Owner Name and Owner ID**.
- 6.2. **Operation Status**:
 - 6.2.1. **Logic**: if the truck Not active or take any status, **must not display** in booking, and can't take any operation action on it.
Also This applicable for **operation status in driver profile**.

7. User Administration

- 7.1. I tried to change the Password, but the field and button are disabled, Admin must be able to change the password form User Profile.
- 7.2. In Driver View, Buttons of Reset Password must open the linked User profile with the driver.

8. Document Handover

- 8.1. Below Fields must have filter starting from **Booking**,
 - Booking Item filter on Booking
 - Shipment filter on Booking Item
 - Doc Record filter on Shipment

Note: *Any units in the system the filter of booking and other related fields must ably*

9. Operation Action

Operation Action Master Setup & Logic Document

9.1. Main Fields, Dependencies, and Sequencing Rules

Fields & Options Mapping

Field Name	Options	Business Logic / Behavior
Action Scope	• Job • On Call • Without	• Job: Applied to the standard Job workflow. • On Call: Applied to on-demand actions. • Without: Restricted to supervisor-only actions.
Sequence Category	• Job • Empty Move • Without	• Job: Linked to the Job scope; displays the action within the Job workflow. • Empty Move: Dedicated sequence for empty movements. • Without: Indicates no sequence and no workflow.
Sequence Number	<i>Sequential Number</i>	Defines the specific order of the action sequence.

9.1.1. Conditional Dependencies & Validation

9.1.1.1. **Activation Rule:** The Sequence Category and Sequence Number fields are only triggered and applicable when the Action Scope is set to Job or On Call. Selecting Without in either scope or category automatically disables both the workflow routing and sequencing logic.

9.1.1.2. **Consecutive Numbering Rule:** Within each specific Sequence Category, the Sequence Number must be consecutive and unbroken (no gaps allowed). The numbering must start from 1 (as an integer) and increase sequentially to the last existing record.

9.2. Action Master Configuration Buttons

Toggle Name	System-wide Limit	Required? (Mandatory)	Function / Behavior
Auto Movement Post	Exactly 1 action	Yes	Automatically creates a movement in the system.
Auto Shipment Post	Maximum 1 action	No	Optional toggle.
Auto POD Post	Maximum 1 action	No	Optional toggle.
Hard Copy Collection	Maximum 1 action	No	Optional toggle.

9.3. Status Impact Section

9.3.1. All fields in this section are optional. When a specific status is selected, it will automatically trigger and update that entity's status when the action occurs. Selecting "Do Nothing" applies no changes.

9.3.1.1. **Booking Status Impact:** Options include "Do Nothing" + exactly all standard system Booking Statuses.

- 9.3.1.2. **Shipment Status Impact:** Options include "Do Nothing" + exactly all standard system Shipment Statuses.
- 9.3.1.3. **Movement Status Impact:** Options include "Do Nothing" + exactly all standard system Movement Statuses.

10. UI/UX

- 10.1. Leftover design instructions and comments (e.g., "list") are currently visible above or below field names. This issue is scattered across all system modules.
 - 10.1.1. Cleanup: Perform a comprehensive cleanup across all modules to remove these design-related comments. (Use the attached images as reference examples).
 - 10.1.2. Retain only genuine, user-facing descriptions that are essential for explaining a field's purpose.

Example:

Order Type *

-Select order type-

List values: CASH, Credit

Sales Report

-Select sales report-

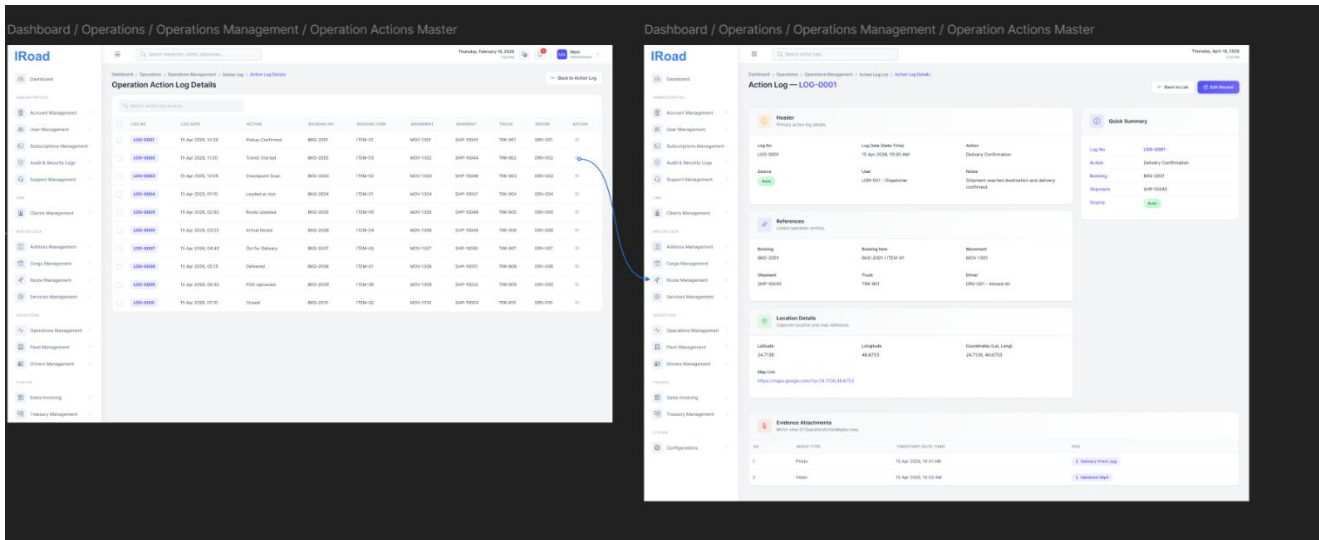

Desktop filtered by Booking, auto-linked when included in a Sales and Sales Report.

11. Critical Bug: Missing Log Screens

- 11.1.1.** The following screens are currently completely unavailable and do not appear in the system:
- Action Log (Enter form)
 - Log Action detail's view
 - Operation Action log details

This is a critical issue; these screens must be enabled and made visible immediately.

[illegible]

12. Driver App

Critical Bugs: Driver Application Core Logic Failures

12.1. Empty Move Workflow Failure

Current Behavior: Clicking "Start Empty Move" does not work unless the Admin manually creates a movement first. Furthermore, even after manual creation, the workflow gets stuck and fails to progress.

Expected Behavior: Clicking "Start Empty Move" must immediately initiate the movement and automatically trigger the sequence/workflow defined in the Operation Action without requiring Admin intervention.

12.2. Incorrect Job Visibility Logic

Current Behavior: Jobs do not appear in the driver app until the Admin manually creates a shipment.

Expected Behavior:

- The Job must become visible to the driver immediately after the Booking is created.
- Round-Trip Scenario: As soon as the driver completes and closes the first shipment, the Job for the next shipment must automatically appear.

12.3. Inverted Route Display (Critical UI Bug)

Current Behavior: When a shipment is created for a route (e.g., Jeddah to Yanbu) but designated as Inbound (Yanbu to Jeddah), the app incorrectly displays the base route direction ("Jeddah to Yanbu").

Expected Behavior: The app must dynamically display the actual direction based on the shipment type. For an Inbound shipment, the direction must be reversed (e.g., displaying "Yanbu to Jeddah").

13. Remove the control of the serial number of **Organization Profile, user must not able to control this value.**

14. Sales Invoice Report

14.1. Invoice Report Logic & Validation Rules

14.1.1. Duplicate Prevention: Do not allow duplicate records (Bookings, Shipments, or Surcharges) to be added to the invoice report.

14.1.2. Booking Eligibility Criteria: A booking can only be included in the report if both of the following conditions are met:

14.1.2.1. Booking Status = Completed

14.1.2.2. POD Status = Completed

14.1.3. Manual Entry Logic:

14.1.3.1. Shipments must be filtered based on the selected Booking(s).

14.1.3.2. Surcharges must be filtered based on the selected Shipment(s).

14.1.3.3. Auto-Fetch Related Records: Upon selecting a booking during manual entry, the system must automatically fetch and pull all its related shipments and surcharges.

14.1.4. Currency Symbol Display: The displayed currency symbol must dynamically link to the approved system currency.

15. Print Templates:

15.1. Problem: Some printout templates do not match the approved designs, while others are completely missing from the system.

15.2. Required Action: Please review the previously sent email containing the printout design specifications and ensure all templates are fully and accurately implemented in the system.

Driver App Additional Comments

16. Evidence Upload Screen

16.1. Field Configuration: The **Comment** field must be **optional**.

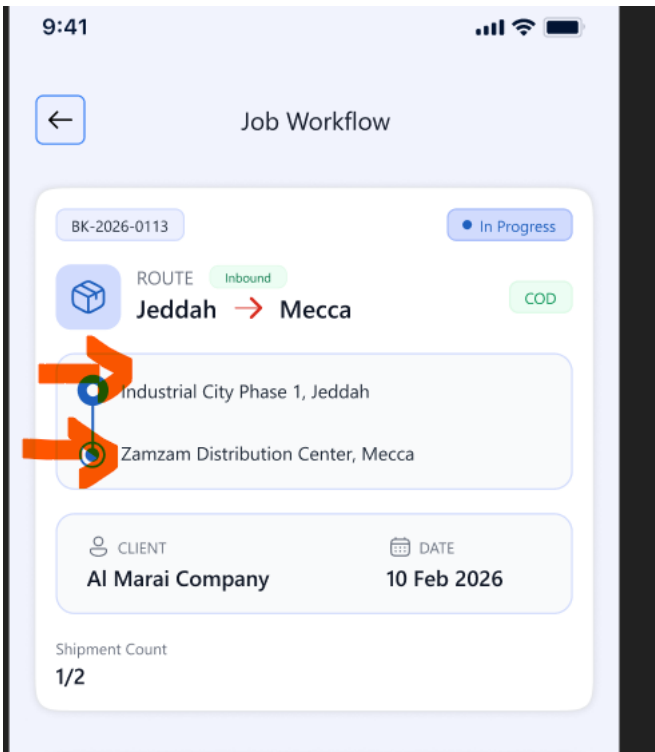

17. Payment Screen

17.1. Collection Logic The driver must **collect either the exact amount** displayed or any **higher amount**. The system will block any amount lower than the requested total.
Can't Collect less than the Amount.

17.2. Field Configuration: Both the **Comment** and **Attachment fields** must be optional.

18. Address Navigation & UI Map Indicator

- 18.1. Clicking on either the Loading (Pickup) or Unloading (Delivery) address must automatically open the Google Maps link in a mobile browser or navigation app.
- 18.2. The link must be dynamically pulled from the Google Maps URL field previously saved by the data entry user within the address record.
- 18.3. Display a recognizable map or location icon next to the address names to visually prompt the driver that the field is clickable and interactive.

19. Remove the yellow "On Call" badge/label located at the top-right corner of the workflow card component
